

MetroAir would like to introduce you to the world of ENERGY RECOVERY VENTILATORS (ERV)

Ventilate your home to help remove indoor air pollution, control humidity and save energy.

Protect your health - breathe cleaner air!

✓ **Indoor air can be more harmful than outdoor air** Up to 100 times more pollutants can be found indoors than outdoors i.e. off gassing from new carpets, cabinetry and furniture, dust mites, mold, bacteria, cooking and cleaning gasses. New homes are especially at risk because they are built so airtight. Stale, polluted air can't escape and continually builds up in the home for you to breathe day after day.

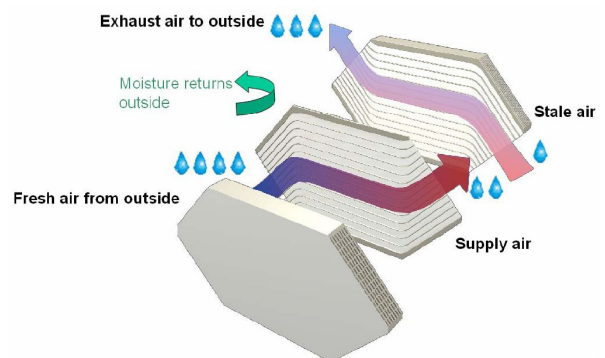

✓ **Poor air quality can trigger health problems** such as headaches, fatigue, poor concentration and respiratory ailments and can also aggravate existing problems. Today's new homes are built so airtight they require ventilation equipment such as ERV's to breathe. Just like your lungs, ERV's bring in fresh air and expel stale, polluted air.

Bring fresh air into your home while reducing your energy costs.

✓ **It costs money to heat and cool the air in your home - why let it escape through open windows?** With an ERV you can still receive the benefit of bringing fresh outdoor air into your home without causing your furnace and air conditioner to work overtime and waste energy.

✓ **An ERV system allows fresh outdoor air to circulate throughout your whole home** (not just the rooms where a window might be open).

✓ **Breathe fresh air and save energy all year - During the heating season** – in a unique energy saving process, an ERV utilizes the heat from the air being expelled to warm up the fresh outside air being brought inside. **During the cooling season**, the ERV will use this same transfer process to cool the fresh outdoor air before bringing it indoors. Moisture in the air is returned outside.

Protect your home investment!

✓ Today's houses are built so airtight that humidity can get trapped inside. As a result, condensation forms on your windows and doors which can cause moisture damage to window frames and surrounding walls. An ERV can expel this excess humidity.

✓ **Basements are a magnet for humidity so they can become a breeding ground for mold and mildew which can cause damage** (not to mention a bad odor). By properly ventilating your entire home with an ERV, excess humidity can be vented outside.

Don't Delay! Call MetroAir Today!

"TRUSTED BY FAMILIES LIKE YOURS FOR OVER 50 YEARS!"
